Module 1,2 completed

Uat done

Feedback list 52(jira)

Summary done

3 bugs

Duplicates 3

Discuss need

Last 4

1. IV testing view should change(inspector)

Like excel view

Parallel testing cant done (grid view)

One marking view can have one instrument have 3 input fields

The large grid view cant display all 3 values.

View cant fit,it

(but it should check one by one)

Testing view initiate testing button

Subsequent verification

Customer application send

That Function should be apply to field officer view

(Because customers individually fill their forms there will be a problem,but if that is done by a field officer it will be easy.)

Eg.there may be customers who dont have phone number,email etc

QR code code use to check by system

Final suggestion

Account should be based on QR(on instruments)

[eg.if](#) there is a customer without phone

Take his nic and account created.

After he can take a phone number and that created account should be access via new phone

Nic unique.

This was done by a field officer.

So otp not received by customer ,that customer cant access that account.

When he receive a phone number that day he should be able to access account.

Development officer can make a account in (no email,phone)

[eg.if](#) customer no have computer literacy(there should be deliver card with username+password+goverment logo)

Advantage of phone number

Can send messages via sms(expire,...)

.

The first 2 are done.

Customer should select
His instruments serial numbers

First time
Inspector visit customer premises
And the first time a customer's registration was done by an inspector.

If Sv onsite agent should select
First time

QR code or registration
Serial number /pattern approval number

Pattern approval when made
Manufacture details should
Agent application when doing
After service ,quality model continue cant
Agent + manufacturer relationship highly recommended.
Pattern approval certificate should be received by manufacture.
Manufacturers should have separate registration.
foreign/local Manufacturer
Now process
Search manufacturer details via their original website.

The agent should have knowledge according to the registration of the manufacturer and he should be advised about his manufacturer registration.

International manufacturer there should be a separate format
Eg:local agent saying
When putting pattern approval manufacturer details should be available to search.

Manufacturer contact+approved models
Suggestion
Local agents should receive the original foreign manufacturer letter.
Authorization letter.

When sellers are selling instruments
Account selection happen
Without account (buyer dont have account)
Nic should be compulsory.
An nic account should be created.

When buying and selling
Account nic

When agent selling his instrument for seller
Sold status display.
When put sold status
New buyers can add details.
Instrument should be added.
(sold date/

Seller dont need to confirm.
Nic search account should be select

Sold +purpose(legal/industrial)
Broken

For SV process there should be true data
Public message.

=====

If all test pass

Eg 500 tested
100 fail
Passed 400 should be one time entered .
Group should be entered.
Sticker no+ serial no

Not feasible
Beam scale weights (consider as one instruments)
But weights dont have serial number
But beam scale is having unique number
Weights are belong to that beam scale

Weights set +beam scale
1 unit
Inspector pattern approval
Weight set box(serial number)

Pattern approval should be (beam scale+weight set)

Weight set box
Separate cost
Eg. beam scale +weight set (6)

If beam scale with missing weight
It shouldn't be registered.

(concern with inspector can take decision)

Practical situation

=====

Offline mode

Web application

To be rfp

=====

The director may have a power cancellation certificate any time.

=====

Tax invoice

Separate tax invoice

Every customer should have (tax invoice +wme)

Format should be changed.
